## Accessing the SA-8 DSP – First Time Setup

# PLEASE READ THE BELOW INSTRUCTIONS BEFORE BEGINNING FIRST TIME SETUP AND CONNECTION TO THE SA-8DSP AMPLIFIER

**For latest software and firmware updates go to [www.wisdomaudio.com/electronics-2/](http://www.wisdomaudio.com/electronics-2/)**

**Wisdom Audio recommends using Firefox Web-browser on both Windows and MacOS**
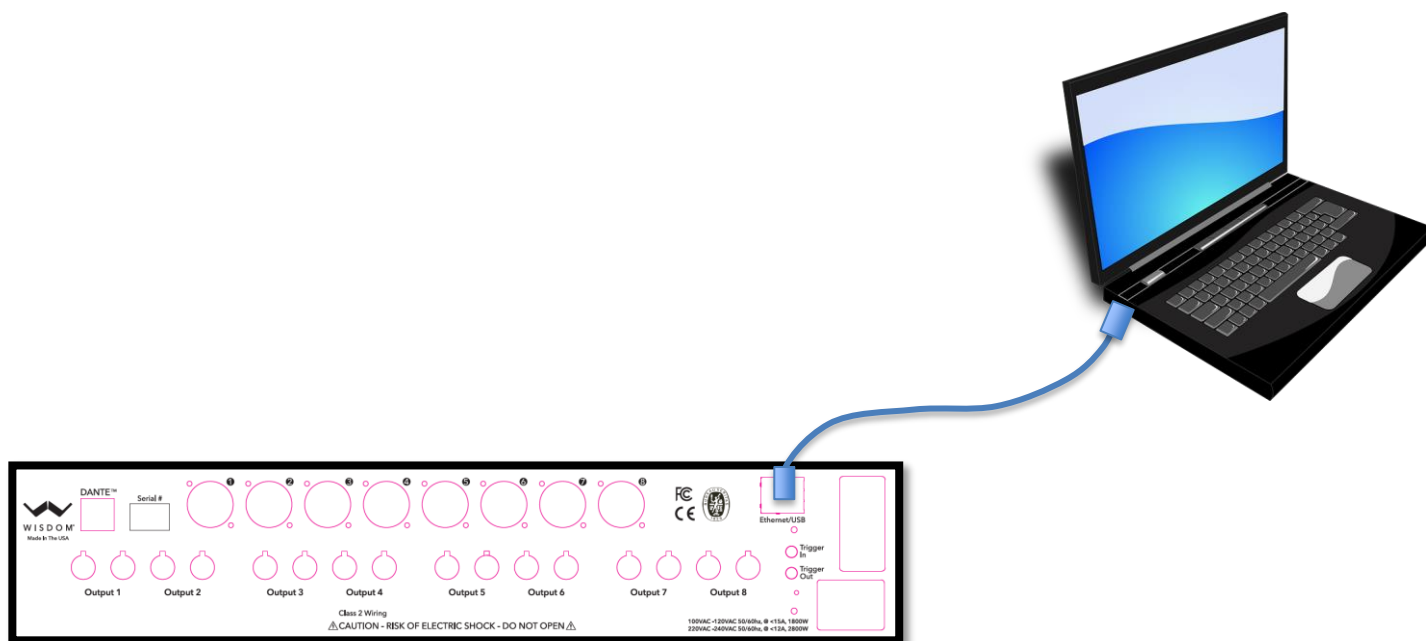

The SA-x DSP Amplifiers are configured via ethernet by accessing the Speaker Wizard from a web browser. There are several connection options below. For multiple amplifiers on a single network, we recommend connecting one at a time, and renaming them with a unique name or Static IP Address.

**First Time Setup – Use Direct Connection using Ethernet without a Network or Router**

The simplest option is to connect directly without a router. By default, the SA-8 will have an IP Address of 169.254.0.8. Note that you can only connect one (1) SA-x at a time with this method and your computer must have a wired ethernet connection. A switch (*not a router*) can also be used to simplify the connections. WiFi cannot be used.

Connect the SA-8 unit to the Ethernet port of your computer by plugging an Ethernet cable from the computer directly to the SA-x without a router or switch. Turn on the unit and take it out of standby.

Open your web browser and enter the IP Address of [169.254.0.8/wizard.html](http://169.254.0.8/wizard.html) to access the setup wizard.
